Using the ‘Search Limiting’ options in EBSCOhost

When searching databases in the EBSCOhost platform you have the option to make your final result more specific so the information you find meets your needs even more. This can be done by using the ‘search limiting’ options available. These options include values such as publication date, language, age range etc.

If you are searching more than one database, the limiters common to each of the databases appear under the Refine Results heading on the search screen.

If you want more of a selection and wish to see limit options for each of the databases you have searched, click on the Show More link.

This will display the limit options for each of those databases.
Your final result, after you have selected your limit options, will be displayed in your Search History.

Remember – if you use a search limiter but then want to start a brand new keyword search, you need to remove the limiter first: otherwise the limiter you have used will continue to apply to the new search as well.
